

Poluaksijalne pumpe Tipa PKH

CROATIA PUMPE

Poluaksijalne pumpe Tipa PKH

Nalaze najčešće primjenu kod velikih količina i malih visina dobave. Ova karakteristika »brzohodnih« pumpi, koje kod malih visina dobave rade s relativno velikim brojem okretaja, omogućuje poluaksijalnoj pumpi široko područje primjene i rad s vrlo visokim stupnjem djelovanja. Naše normalne serijske pumpe nalaze primjenu kao rashladne pumpe u energetskim postrojenjima, za navodnjavanje i odvodnjavanje, u industriji, rudarstvu i sl. Obzirom na velike poprečne presjeke, ove pumpe nisu osjetljive na nečistoće i strana tijela sadržana u mediju, ukoliko ne prekorače određenu mjeru.

Područja dobave

Standardne veličine pumpe tipa PKH pokrivaju područja dobave od 250 do 6500 m³/h, kod visina dobave od 3 do 30 m. Na dijagramu su prikazana područja dobave pojedinih veličina pumpi, kod najpodesnijih brojeva okretaja elektromotora (1450, 960, 730 i 580 min⁻¹) i frekvencije od 50 Hz. Pumpe izvan prikazanog područja nudimo na upit.

Konstruktivne karakteristike

Konstrukcija naših poluaksijalnih pumpi je veoma jednostavna, a vrlo jaki pojedini dijelovi garantiraju veliku pogonsku sigurnost svojstvenu za ovaj tip 2 pumpi. Kolo rotora, sa širokim prolaznim kanalima, učvršćeno je konzolno na jako vratilo, koje je uležišteno u kotrljajućim ležajevima, podmazivanim mašću. Kompletna pumpa stoji na dvjema jakim nogama smještenim na spiralnom kućištu. Na mjernim skicama date su glavne dimenzije pumpi, za standardne položaje tlačne prirubnice (VG, HO, KOD). Pumpe sa drugim položajem tlačne prirubnice, izrađujemo prema posebnoj narudžbi. Pored toga ove pumpe proizvodimo i s vertikalnim položajem pogonskog vratila.

Brtvenice

Za brtvljenje kućišta, na mjestu prolaza vratila, uobičajena je upotreba grafitiranih pletenica. U brtvenom prostoru smješten je također i prsten, koji omogućuje dovod brtvene vode ili masti, koja sprečava prijevremeno habanje zaštitne puškice vratila. Na poseban zahtjev mogu biti ugrađene mehaničke brtve.

Half Axial Pumps Type PKH

Main avenue of use for these pumps is in cases of large quantities and low manometric heads. This property of high-speed pumps, which at low manometric heads work at relatively high rpm, which allows for this half axial pump a widespread area of use with a very high degree of effectiveness. Our standard PKH pumps are most often used as cooling pumps in energy installations, for irrigation and drainage, in industry, mining etc. Considering large cross sections, these pumps are able to withstand, to a certain degree, turbines and foreign bodies in the medium.

Supply Ranges

Standard sizes of PKH pumps cover supply ranges from 250 to 6500 m³/h and total manometric heads from 3 to 30 m. Diagram shows supply ranges for each individual pump, at most apt electromotor rpm's (1450, 960, 730, 580 min⁻¹) and frequencies from 50 Hz. Pumps outside shown ranges are offered at special inquiry.

Design

Our half axial pumps are of simple design, but sturdiness of operative parts guarantee high degree of safety for this type 2 pump. Impeller, with wide lane spaces, installed as a console on a sturdy shaft mounted in roll-bearings lubricated with grease. Entire pump stands on two legs located on spiral casing. Supplied cross-sections show main dimensions of the pumps for standard positions of the discharge flange (VG, HO, KOD). Pumps with different position of discharge flange are manufactured to special order. Additionally, these pumps are also manufactured with vertical placement of the drive.

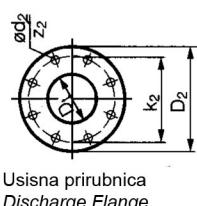

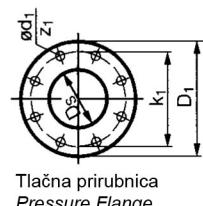

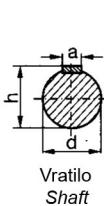

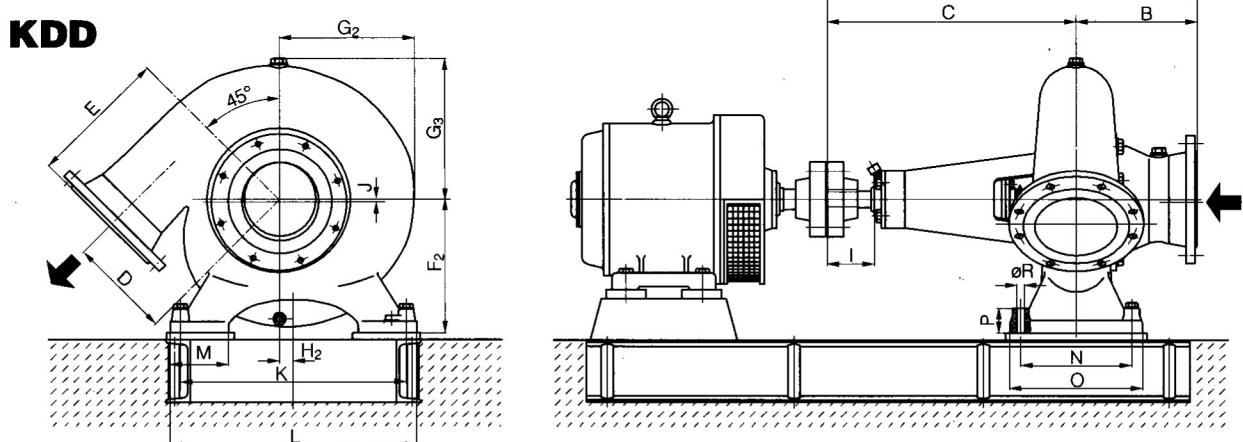

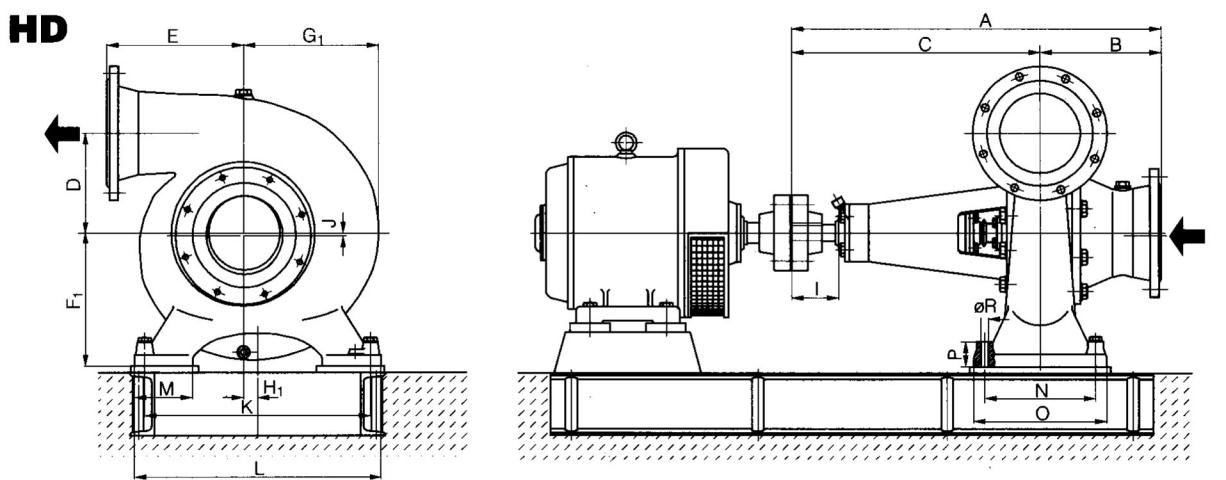

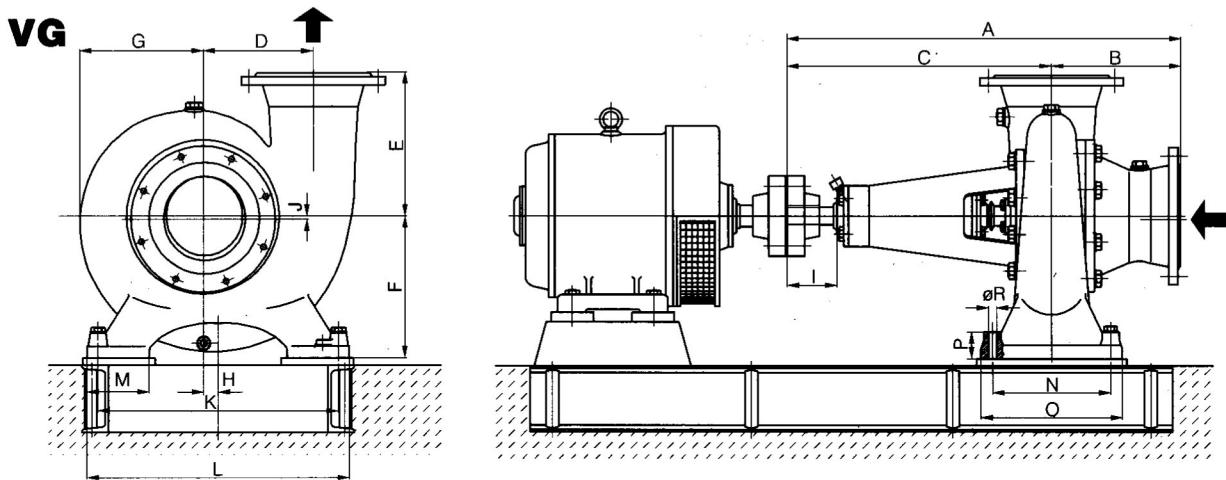

Sealing

As a sealing in position of shaft exit out of the casing graphite packing is used. In sealing space ring is installed which allows for intake of grease or water which prevents preterm ware of shaft security bush. At special request mechanical seals can be installed.
